

**Supplemental Fig. 2**

**Supplemental Fig. 2:** Co-expression of myogenin and Mef2D induces endogenous MCK expression in 3T3-L1 preadipocyte cells. 3T3-L1 preadipocytes were infected with the indicated retroviruses and allowed to differentiate for 30 hours using the same protocol used for infected fibroblasts. mRNA levels of each gene were examined by quantitative real time PCR. Fold induction was defined as the ratio of the levels of the indicated gene in a given sample relative to the levels of Hprt in the same sample and are presented relative to the levels present in the MyoD infected sample. The data represent the average of two independent experiments.
